

China supplies about 86% of primary magnesium

World primary metal production, 2025 estimates

Share of world primary production

1.1 million t

World total

950,000 t

China

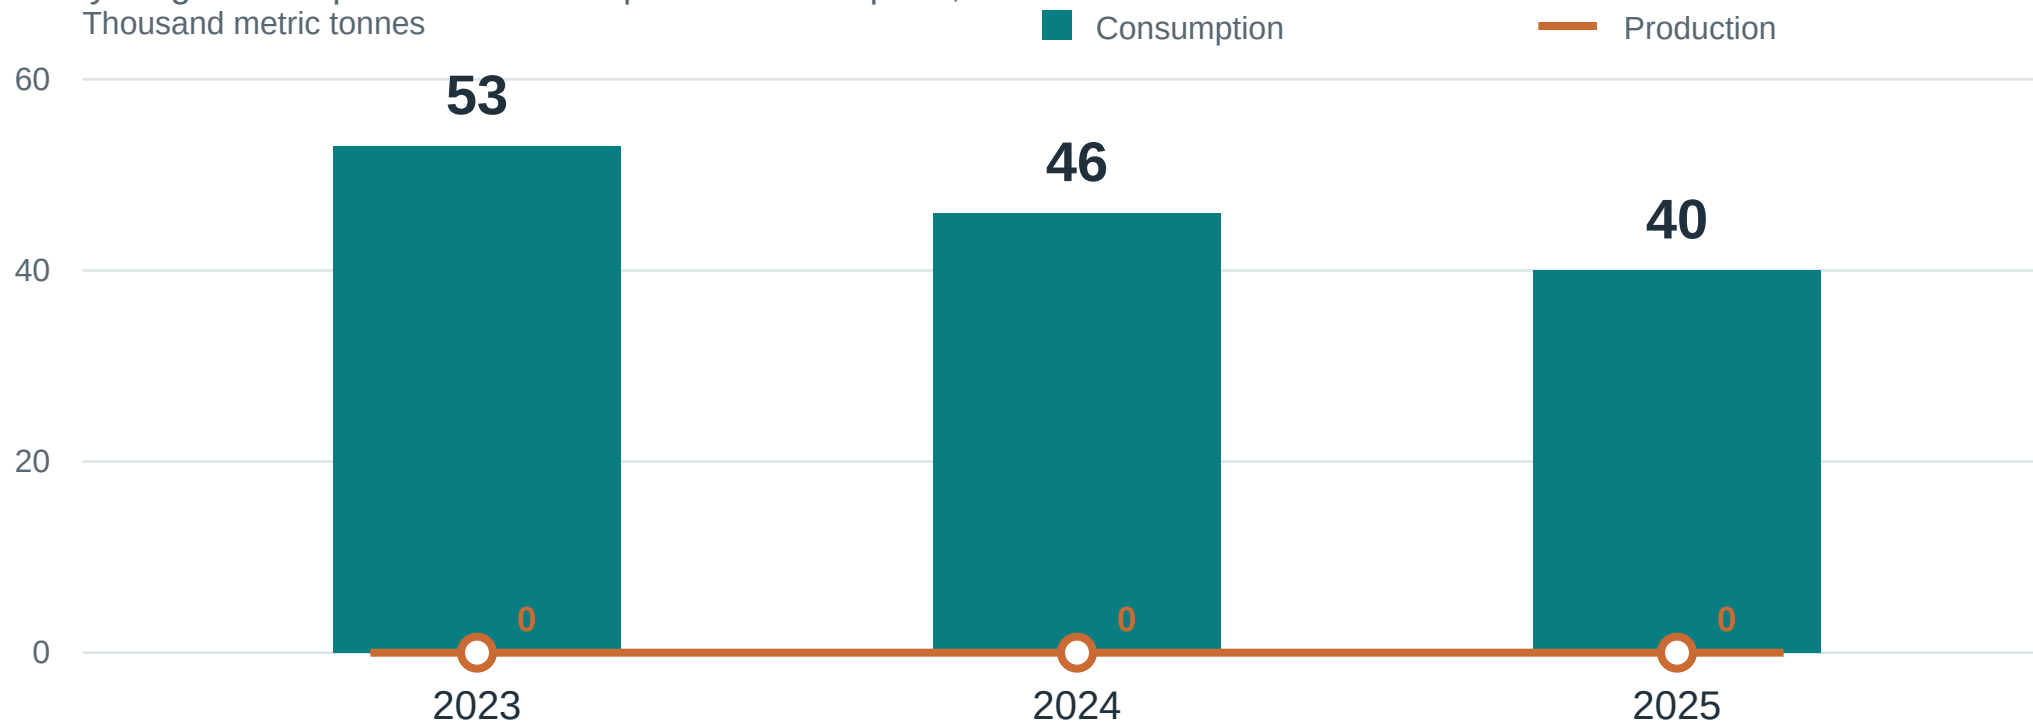

~150,000 t

Other countries, derived

Other countries = rounded world total minus China; not a sum of country estimates.
Primary metal only. Recycling, compounds and nameplate capacity are excluded.

No U.S. primary output, yet 40,000 t consumed

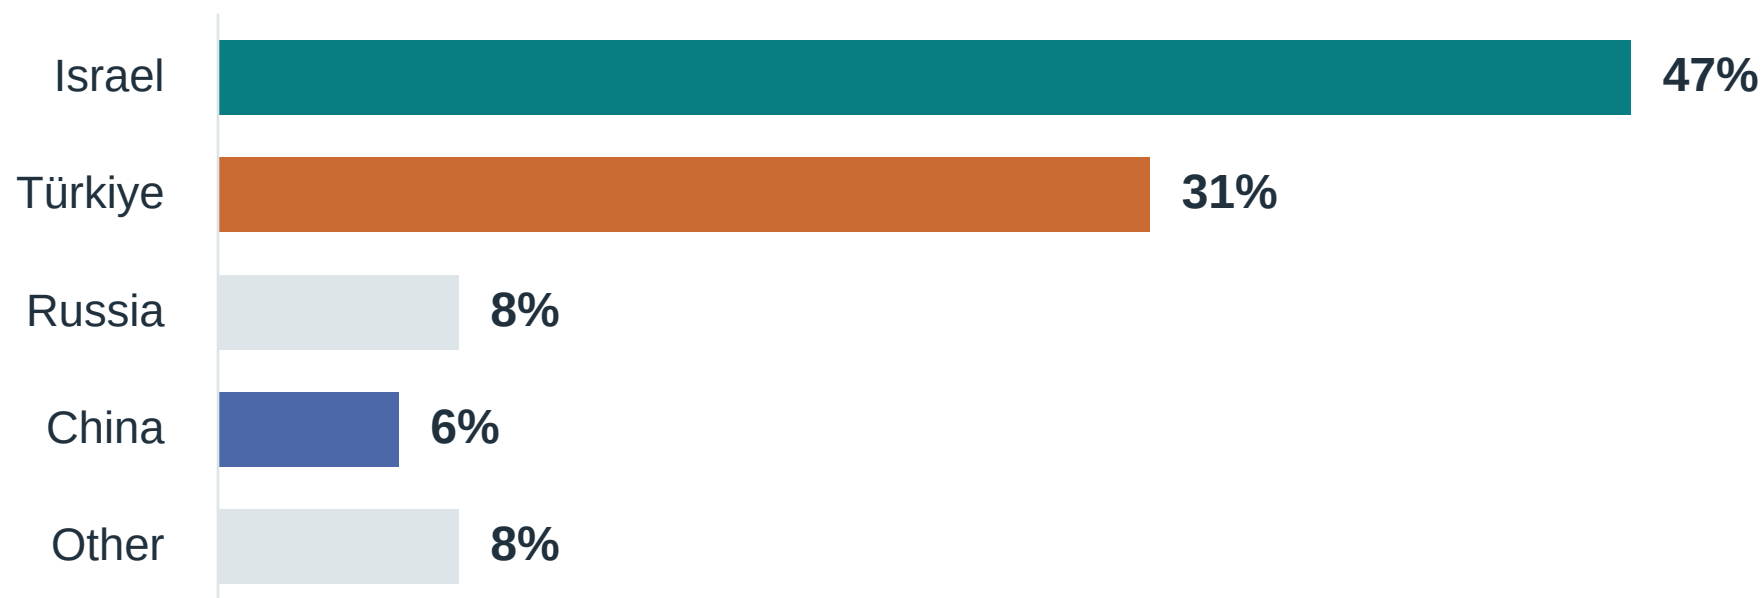

U.S. primary magnesium: production and reported consumption, 2023-2025

2025 consumption is estimated. Reported primary consumption is not total apparent consumption. Domestic recycling is outside these series. The observed consumption trend is downward.

Israel and Türkiye supplied 78% of U.S. pure-metal imports

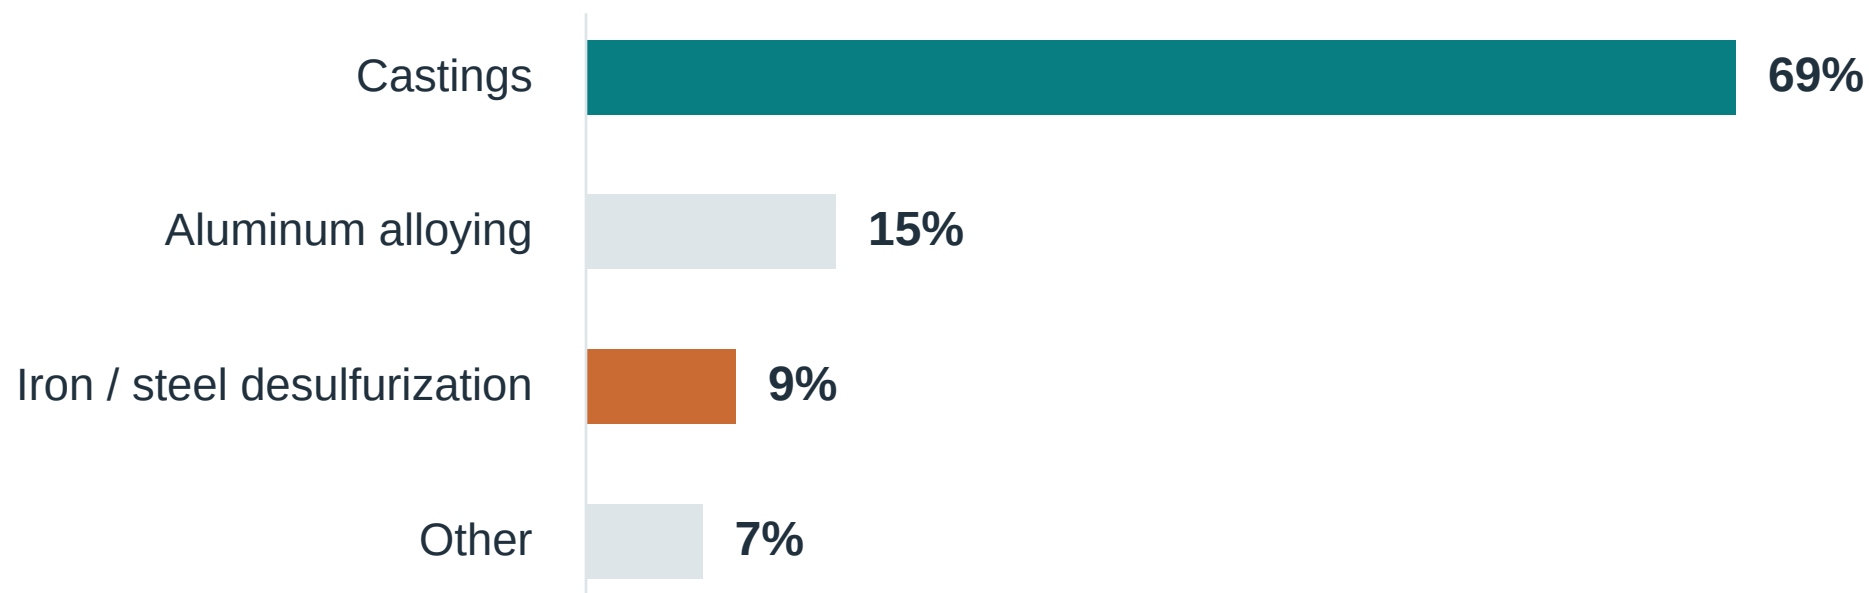

U.S. import origins, 2021-2024 pooled shares

USGS metal category: 99.8% purity. This is a multi-year origin mix, not a 2025 snapshot. Import origins differ from the geography of world primary production.

Castings dominate U.S. primary magnesium use

Share of reported primary magnesium consumption, 2025 estimates

Castings are principally for the automotive industry; 69% is not an automotive-only share. Applies to primary consumption. It does not describe all recycled magnesium or named buyers.

Recycling does not all return as pure Mg ingot

Forms in which U.S. secondary magnesium was recovered, 2025 estimates

Share of recovered secondary magnesium

In aluminum-base alloys

Magnesium stays within an alloy stream.

Mg castings, ingot and other

A mixed group, not all pure merchant ingot.

Shares are of recovered magnesium, not the gross weight of aluminum-alloy products.
New and old scrap are included. This is recovery form, not the separate end-use mix.

Electricity price and consumption both matter

Illustrative scenarios: electricity cost per kilogram of accepted magnesium

Assumed total plant electricity: 10, 15 or 20 kWh/kg; these are not measured plant results.
Electricity only. Excludes direct fuel, feed, reagents, labor, capital and other costs.
